

Al Overview

To protect underlying data in Tableau Public, users can utilize several methods, including disabling "Include Command Buttons" on tooltips, using Tableau Public Premium for larger datasets or sensitive information, and implementing row-level security (RLS).

Here's a more detailed breakdown:

1. Disabling Tooltip Options:

Before publishing to Tableau Public, disable the "Include Command Buttons" option on your visualizations' tooltips in Tableau Desktop. This prevents users from clicking to view or download the underlying data.

2. Tableau Public Premium:

Tableau Public Premium offers features to hide underlying data and restrict workbook download capabilities for datasets larger than 100,000 rows or those containing sensitive information.

3. Implementing Row-Level Security (RLS):

Data Source Level RLS:

RLS can be applied at the data source level, allowing you to control which data a specific user sees based on their Tableau Public login or other user characteristics.

Workbook Level RLS:

RLS can also be implemented at the workbook level, using filters to restrict access to specific rows or columns of data within the workbook.

Methods for Implementing RLS:

- Create User Filters: Manually map users to specific values or create dynamic filters based on a security field in your data.
- Use Data Policies (Tableau Data Management): For more advanced control, virtual connections with data policies can be used to enforce RLS at the connection level, according to Tableau.

4. Other Considerations:

Data Cleaning:

Before publishing, ensure your data is cleaned and any potentially sensitive information is removed or anonymized.

Permissions:

Carefully manage Tableau Public permissions to control who can access and interact with your visualizations.

By utilizing these methods, users can effectively protect their underlying data when publishing visualizations to Tableau Public.
